Sensitivity Analysis with Respect to the Choice of k

This PDF contains eight figures illustrating the sensitivity of the proposed IF-CPD to the choice of k.

Specifically, the figures are organized into two categories:

Subspace settings (6 figures):

For each of the two subspace scenarios (SPD subspace and probability distributional subspace), we provide three figures.

Each figure corresponds to a pair of sample sizes, namely n = (400,600), (800,1000), (1200,1600).

Each figure shows the average ARI (Adjusted Rand Index) as a function of kkk, computed over 500 Monte Carlo simulations.

Full space settings (2 figures):

For each of the two full-space scenarios (SPD space and probability distributional space), we provide one figure corresponding to sample sizes n = (400,600).

In each of the eight figures, eight curves are displayed, corresponding to two sample sizes (n), two numbers of change points (K), and two spacings between change points (c).
